

Get down to the bottom line of Human Risk Management

See how safeguarding your organization's email communications leads to impactful business outcomes.

A look at Human Risk

90%

of attacks start with email

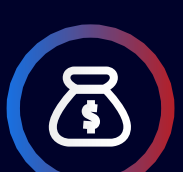

1 in 17

messages contain sensitive data

8%

of employees account for 80% of security incidents

\$15m

is the average cost of an insider leak

What this tells us:

It's just as important to **protect the human element** as it is the tech stack.

Protect the human element with Human Risk Management

When we better understand people's thought processes, actions, and motivations, we can see where the risk is and improve security across the organization.

Human Risk Management

The ROI of Mimecast's multi-layered defense

Integrating AI with traditional methods for preventing threats leads to targeted mitigation strategies that protect human collaboration regardless of the attack.

We help you understand the actions users take, the attacks your organization is subjected to, and the access users have.

Through our Human Risk Management Platform we provide:

Risk visibility

With 8% of employees responsible for 80% of security incidents, Mimecast pinpoints high-risk individuals so you can focus protection where it matters most and reduce organizational risk.

Human intervention

Since employees spend 80% of their time outside email, Mimecast extends real-time protection beyond the inbox, intervening wherever risky actions are detected to stop threats before they spread.

Adaptive protection

Having a 360-degree view of what's happening in your organization means attacks never reach an inbox, so you can protect 100% of the users.

Take your defenses to the next level

Attackers are more sophisticated than ever. How you defend yourself needs to be too.

Mimecast's Human Risk Management Platform leverages AI-driven innovations to help bridge the gap between outside threats and inside vulnerabilities.
