

Get More From Microsoft 365 with Mimecast

Microsoft 365 is a powerful platform and a significant investment. Mimecast is built to make the most of it, adding the layers of protection, resilience, and compliance that take your existing setup from good to enterprise ready.

95%
of breaches involve human error

71%
of IT leaders expect negative business impact from collaboration tools attack

69%
of IT leaders agree AI will be used in attacks against their org

MICROSOFT 365 What it gives you

MIMECAST What it adds on top

Stop the attacks that target people, not just machines

Identity & Threat Protection

Microsoft Defender monitors devices and detects known malware. Entra ID manages identity and supports MFA for access control.

Human & Collaboration Threat Protection

Mimecast layers AI-powered detection on top, catching phishing, impersonation, and business email compromise that are designed to bypass [GG3.1] Defender. No malicious file needed to trigger a block. Plus, stop spoofing and brand impersonation attacks with user-friendly DMARC setup and monitoring.

From alerts to action, faster and with less effort

Security Operations

Microsoft Defender generates alerts and provides a security dashboard, giving teams visibility into threats detected across the Microsoft environment.

Efficient Security Operations

Mimecast runs every message deemed safe by Microsoft through its advanced scanning and applies automated response actions based on the nature of the threat. This reduces the need for manual interventions and active threat hunting for your SecOps team.

Secure every channel, not just email

Collaboration Security

Microsoft Teams and SharePoint include native security controls: file scanning, link checking, and access management within the Microsoft ecosystem.

Collaboration Security

Mimecast extends AI-driven inspection across collaboration platforms, analyzing messages, links, and shared content in real time to catch social engineering and account compromise that native controls miss.

Answer any audit or legal hold request with confidence

Compliance & Data Governance

Microsoft Purview provides data classification, retention policies, and basic eDiscovery tools to help meet regulatory requirements.

Compliance & Data Governance

Mimecast's Governance and Compliance suite retains Microsoft and other collaboration tool data in an immutable, tamper-proof and independently hosted repository. This enables faster eDiscovery, granular retention management, and audit-ready reporting across all email data. [AD5.1][ZB5.2][AD5.3] Better yet, there are no per GB import or batch processing fees.

Zero email downtime, even when Microsoft goes down

Email Resilience

Microsoft 365 delivers email through Exchange Online with solid uptime SLAs and basic continuity built into the platform.

Collaboration Security

Mimecast adds an independent continuity layer so email keeps flowing during Microsoft 365 outages. Employees send and receive as normal, with no disruption to sales, invoices, or customer communications.

Exchange is a great defender, but it's not good enough on its own. It's not focused on email security in depth. Mimecast's AI and libraries set it apart from what Microsoft offers.

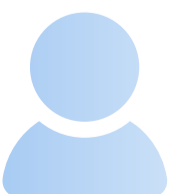

Nikki Tan
Global Head of IT,
Aqua Expeditions

Mimecast is a straightforward solution. Its API driven nature makes it easy and straightforward to orchestrate. Not to mention actually getting a return on investment through the experts at Mimecast. It really does feel like a partnership model where someone is trying to help you consistently to get the best out of the solution and the service.

Tony Clarke
VP of Information Security
and IT Operations, Marken

Mimecast has given us back control over our email communication. Threatening messages are blocked, and our administrators work much more efficiently.

Francesco Scognamiglio
Managing Direct, Senata
