

Detect Risk to Data and Automate Response to Insider Threats

Mimecast® Incydr integrates with Cortex™ XSOAR by Palo Alto Networks to surface risk to data and accelerate response to insider threats.

This integrated offering combines the visibility and context of Incydr – including its library of hundreds of Risk Indicators used to prioritize risk – with Cortex XSOAR’s comprehensive security orchestration platform to enable security teams to scale, standardize and automate their insider threat processes.

Integration Overview

Employee lifecycle free content pack

- Ingest alerts from Incydr
- Add and remove employees from the Incydr’s watchlists for departing employees, new employees, contractors or other high-risk users
- Trigger a forensic lookback of the file and event metadata for high-risk employee file activity

Response flows

- Search activity detected by Incydr to gather detail needed for forensic review
- Automate ticketing processes for incident response
- Trigger response controls to suspicious employee activity, such as removing their access or quarantining their endpoint
- Leverage hundreds of Cortex XSOAR third-party product integrations to coordinate response across security functions based on insights from Incydr

The Incydr content packs for Cortex XSOAR playbooks, together with Incydr risk prioritization and signal capabilities, enable security teams to automate detection and response of insider threats and protect against risk to data caused by high-risk employees – whether departing, new, contracted, or those with privileged access.
