## WITH MIMECAST

## WITH ABNORMAL AI

**1**

Every attachment goes through behavioral sandbox, and every URL's destination is deep scanned.

No sandboxing. URL protection only on links Abnormal chooses to flag.

**2**

Choose API, inline or gateway — deploy the way that fits your organization.

API-only deployment — one method, no flexibility.

**3**

One platform covering DMARC, insider risk, Gen AI governance, collaboration, compliance, and more.

Narrow platform scope — payload less detection, MEP, SAT, and ATO. Other vendors are still required for the rest.

**4**

20+ years of threat intelligence. 1.7 billion emails are inspected every day.

Founded in 2018. Six years of threat data to learn from.

**5**

Aggregates signals across threat pillars from leading providers — delivering richer interventions beyond training and testing.

Human risk is limited to phish testing, AI-generated content, and ATO — no broader signal aggregation.

**One platform. API-native deployment — live in minutes, not months.**
